

Resume-Library Browser Automation

Proposed one-page workflow • No Unified.to • No job-seeker communication

1. One-time setup and pilot

Confirm permitted automation, client-sharing rights and account limits.
Establish a secure signed-in browser session; test search and retrieval.

2. You define the search and delivery rules

Position, mandatory skills, experience, education/certifications and location.
Select available recent-activity filters, run days/times, result limit and destination.

3. Scheduler starts the browser workflow

Open Resume-Library and check the authenticated session.
If login/MFA, CAPTCHA or an access restriction interrupts the run, pause and notify you.

4. Search and retrieve matching records

Apply supported filters; open matching profiles.
Download available resumes or extract visible profile fields within approved credit limits.

5. Check relevance, completeness and duplicates

Compare source information with the requisition; flag missing evidence.
Do not invent details or describe listed credentials as independently verified.

6. Prepare and save the delivery package

Preserve original resumes when available; label reconstructed documents
"Agency-prepared candidate profile." Include source, retrieval date and qualification summary.
Save to your chosen local folder or connected cloud storage.

7. Notify you → You review → You submit to SEPTA

Report files delivered, gaps and any incomplete run.
Target: deliver the package within seven calendar days of SEPTA's notification.

Status: Proposed workflow—not yet tested with an authenticated Resume-Library account. Website changes, expired sessions and account limits can require intervention. Browser automation does not bypass hidden data, access controls or subscription charges.

Candidate status: Recent activity is a signal, not confirmation of interest or availability. SEPTA's acceptance of agency-prepared profiles in place of original resumes remains unconfirmed.
